

some characteristics of quenching pdf

In materials science, quenching is the rapid cooling of a workpiece in water, oil or air to obtain certain material properties. A type of heat treating, quenching prevents undesired low-temperature processes, such as phase transformations, from occurring.

Austempering is heat treatment that is applied to ferrous metals, most notably steel and ductile iron. In steel it produces a bainite microstructure whereas in cast irons it produces a structure of acicular ferrite and high carbon, stabilized austenite known as ausferrite.

Steels containing high amounts of manganese (Mn), aluminium (Al) and carbon (C) are sometimes also referred to as â€œTriplexâ€• steels. These materials exhibit low mass density, high strength and excellent ductility in comparison with established steels for structural engineering applications.
